

Vector Databases and RAG

How we search meaning,
not just words

We search **wrong**

Traditional search =
string matching

cats ≠ felines

We need meaning

Text → Vector

We convert text into numbers

Meaning → Geometry

Similar meaning =
close vectors

$$\text{cats} = [0.12, 0.4, 0.34, 0.56]$$

chunks

1w

1sent

emb. word

**Find nearest
neighbors**

cats [0.4, 0.39, 0.56]
[...]
[...]

Can **SQL**
do this?

$cats = [0.12, 0.4, 0.34, 0.56]$

No index

B-tree
doesn't work

$O(N \cdot d)$ $O(N \log k)$
cats = [0.12, 0.4, 0.34, 0.56]
chunks 1st 2nd 3rd

ANN

Approximate Nearest
Neighbor

A, B, C, D, E
A, B, X, D, Y

$O(N \cdot d)$ $O(N \log k)$
cats = [0.12, 0.4, 0.34, 0.56]
chunks →

cats [0.12, 0.4, 0.34, 0.56]
[...]

RAG: how it works

A, B, C, D, E
A, B, X, D, Y
recall

$O(N \cdot d)$ $O(N \log K)$
cats = [0.12, 0.4, 0.34, 0.56]
chunks
A = [1, 100]

ANN vs Brute Force

Brute Force (Exact)

Compare with all vectors

High **accuracy**, low speed

ANN (Approximate)

Compare with a **subset**

High **speed**, slightly less accurate

A, B, C, D, E
A, B, X, D, Y
k=5
3

$O(N \cdot d)$ $O(N \log k)$
cats = [0.12, 0.4, 0.34, 0.56]
Chunks
1w 15ms 6ms

cats [0.12, 0.4, 0.34, 0.56]
[...]
[...]

HNSW: Graph Search

- ① Start at the top layer
- ② Move to nearest neighbors
- ③ Go down a layer
- ④ Repeat until bottom layer
- ⑤ Return best neighbors

A, B, C, D, E

A, B, X, D, Y

$O(N \cdot d)$ $O(N \log K)$

cats = [0.12, 0.4, 0.37, 0.56]

Vector DB Systems

				
	FAISS	Chroma	Milvus	Pinecone
 Type	Low-level library	 Easy to use	 Scalable	 Managed cloud service
 Performance	High performance	 Open source	 High performance	 Fully managed
 Use case	Customizable	 Great for apps	 Enterprise-ready	 Reliable & secure

A, B, C, D, E
A, B, X, D, Y
 $k=5$
Recall@k = $\frac{3}{5}$
 $k=1$

$O(N \cdot d)$ $O(N \log k)$
 $S = [0.12, 0.4, 0.37, 0.56]$
Chunks
 $A = [1, 100]$
 $B = [2, 0]$

Vector DB Features

More than just
nearest neighbor search

Index Types

- HNSW – graph-based, fast search
- IVF – partitions into clusters
- PQ – compress vectors for efficiency

Compression

- Quantization (float $\rightarrow$ int)
- Product Quantization (PQ)
- Less memory, faster search

Metadata Filtering

- Filter by attributes
- Example: language = 'en' and date > 2023

Distance Metrics

- Cosine Similarity
- Dot Product
- L2 (Euclidean)

Advanced Capabilities

Powerful features for real-world applications

Hybrid Search

- Combine vector search with keyword search
- Better relevance and accuracy

Scalability

- Sharding & distribution
- Distributed ANN search
- Handle billions of vectors

Memory Management

- Hot data in RAM, cold data on disk
- Cache & prefetch
- Optimal resource usage

Dynamic Updates

- Insert, update, delete vectors
- Different strategies: HNSW vs IVF

RAG Optimizations

- Store document chunks
- Return top-k with context
- LLM-friendly integrations

We search **meaning**

From keywords to understanding

A, B, C, D, E

A, B, X, D, Y
